APPROVAL

LEEA Commodity Product — Approval Brief

Date: August 10, 2026
Status: Pending approval — do not implement until signed off
Home: `leeacoins-org/` (rebuild from static Netlify dump into product)
Scope: Full product slice — basket definition UI, OR redemption exchange, app wallet, Express + SQLite ledger
Source rules: Commodity definition and exchange schedule as stated 2026-08-09 (WhatsApp)

1. Decision requested

Approve rebuilding `leeacoins-org` into a LEEA commodity product that:

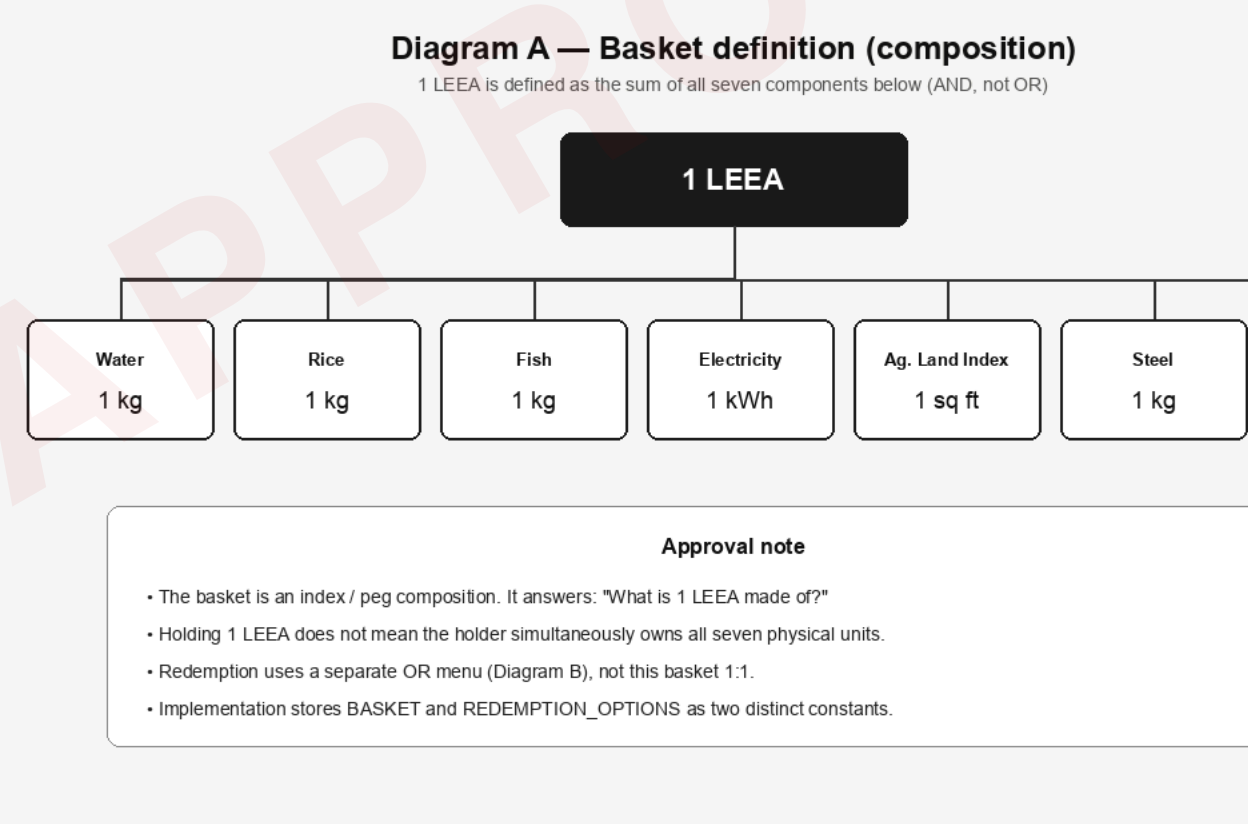

1. Publishes the **basket definition** (what 1 LEEA is composed of).
2. Lets users **redeem whole LEEA** for exactly one commodity from the OR menu.
3. Tracks balances and redemption requests in a local SQLite ledger (off-chain v1).

Sign-off authorizes implementation only. Physical logistics, on-chain mint, and USD peg remain out of scope until a later brief.

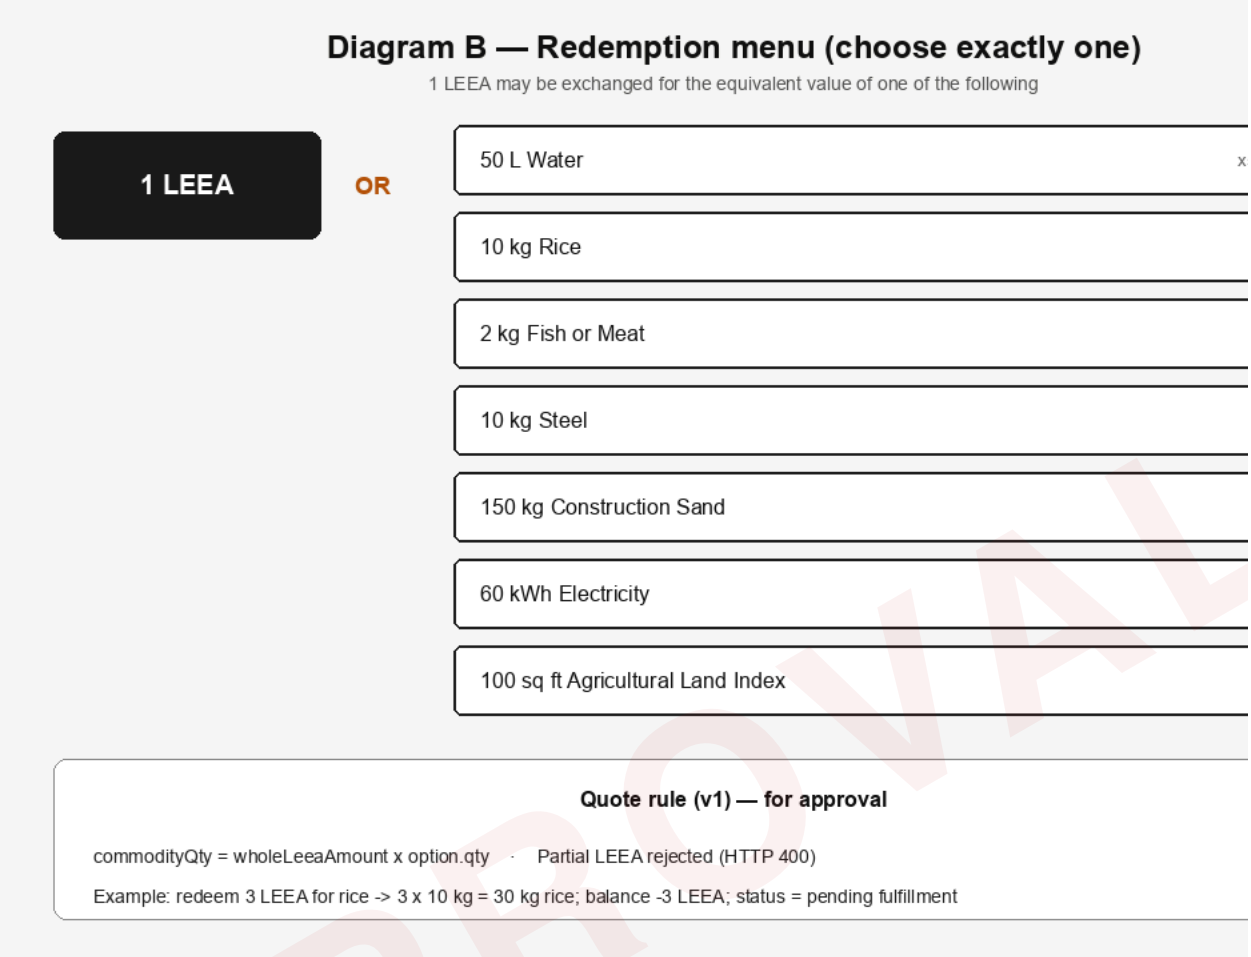

2. Why two layers (critical)

The source messages define **two different economic roles**. Treating them as one formula would ship incorrect product behavior.

Layer	Question it answers	Operator	Implementation constant
Basket definition	What is 1 LEEA *made of*?	AND (all seven components)	`BASKET`
Redemption menu	What can 1 LEEA be *exchanged for*?	OR (exactly one option)	`REDEMPTION_OPTIONS`

APPROVAL

3. Canonical schedules (lock these numbers)

3.1 BASKET DEFINITION — 1 LEEA IS DEFINED AS

#	Commodity	Quantity	Unit
1	Water	1	kg
2	Rice	1	kg
3	Fish	1	kg
4	Electricity	1	kWh
5	Agricultural Land Index	1	sq ft
6	Steel	1	kg
7	Construction Sand	1	kg

APPROVAL

3.2 REDEMPTION MENU — 1 LEEA MAY BE EXCHANGED FOR ONE OF

#	Commodity	Quantity	Unit	Implied multiplier vs basket component
1	Water	50	L	~×50 (treating 1 L ≈ 1 kg water)
2	Rice	10	kg	×10
3	Fish or Meat	2	kg	×2
4	Steel	10	kg	×10
5	Construction Sand	150	kg	×150
6	Electricity	60	kWh	×60
7	Agricultural Land Index	100	sq ft	×100

Quote rule (v1): `commodityQty = wholeLeeaAmount × option.qty`. Partial LEEA amounts are rejected.

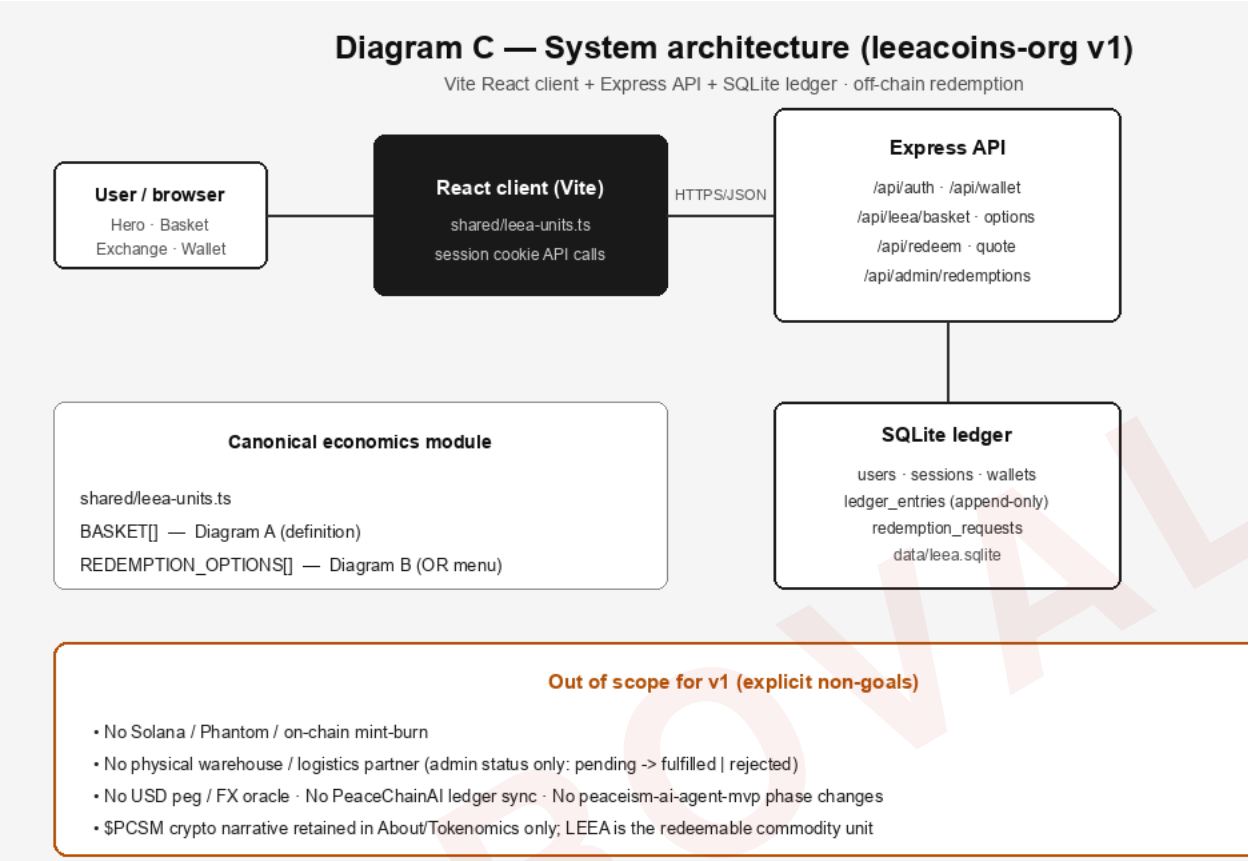

Example: Redeem 3 LEEA for rice → debit 3 LEEA, credit a pending request for 30 kg rice.

4. Product home and brand

Topic	Decision
Repository folder	`leeacoins-org/`
Current state	Offline SPA dump from `peaceism.netlify.app` (no `src/`, no API, branded LeeaCoins / $PCSM)
Rebuild	Archive dump to `legacy/`; new Vite + React + TypeScript client; Express API; SQLite
Primary brand	**LEEA** commodity unit
$PCSM	Related crypto narrative only (About / Tokenomics / whitepaper link); not the redeemable unit
Wallet v1	App account (email/password session). No Phantom / Solana in v1

APPROVAL

5. System architecture

5.1 TARGET LAYOUT

```
leeacoins-org/
├── legacy/                 # current dump
├── shared/leea-units.ts    # BASKET + REDEMPTION_OPTIONS
├── server/                 # Express + SQLite
├── client/                 # Vite React SPA
├── data/leea.sqlite
└── README.md
```

5.2 API SURFACE (V1)

Method	Path	Behavior
GET	`/api/leea/basket`	Return basket composition
GET	`/api/leea/redemption-options`	Return OR menu
POST	`/api/auth/register` · `/login` · `/logout`	Session cookie
GET	`/api/wallet`	Balance + pending redemptions
POST	`/api/redeem/quote`	Preview commodity qty
POST	`/api/redeem`	Debit LEEA; create `pending` request
PATCH	`/api/admin/redemptions/:id`	`fulfilled` or `rejected` (admin token)

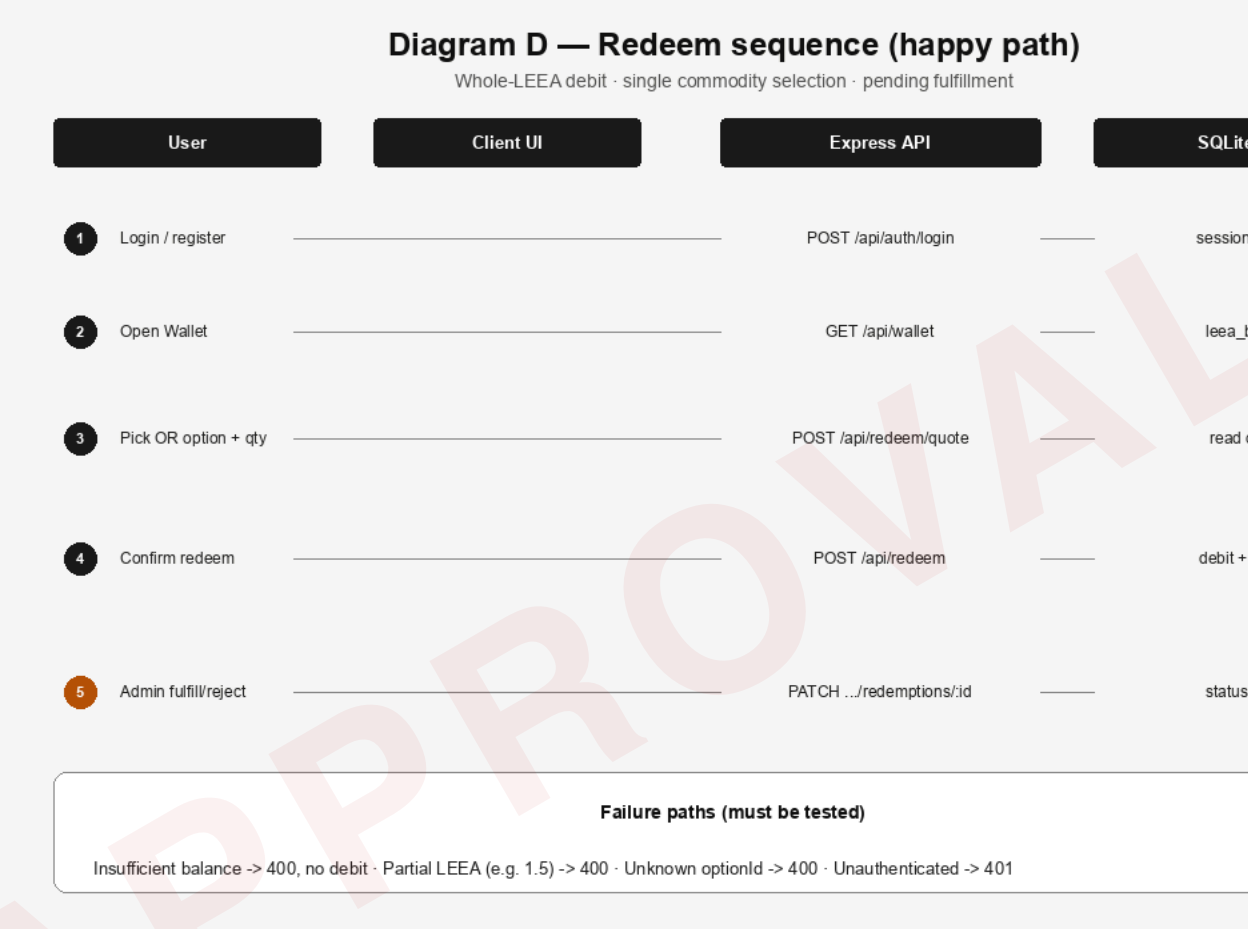

APPROVAL

5.3 LEDGER TABLES

`users`, `sessions`, `wallets` (`leea_balance`), `ledger_entries` (append-only), `redemption_requests`.

Demo seed: one user with **1000 LEEA** so Exchange is usable on day one.

6. Redeem flow

7. UI sections (first product slice)

1. **Hero** — LEEA brand, one headline, one sentence on commodity backing, CTAs: View Basket · Redeem
2. **Basket** — Diagram A content; label as *definition*, not redeemable menu
3. **Exchange** — Diagram B picker + whole-LEEA amount + live quote + confirm
4. **Wallet** — login/register, balance, ledger, redemption status
5. **Tokenomics / About** — LEEA vs $PCSM clarification; remove PancakeSwap as primary LEEA CTA

Visual direction: keep the existing dark glass marketing feel; do not invent a new unrelated theme.

APPROVAL

8. Delivery phases

Phase	Delivers
1 — Scaffold	`legacy/` archive; Vite + Express + TS; shared units; `npm run dev`
2 — Ledger API	Auth, wallet, quote, redeem, admin status; Vitest for quote math and failures
3 — UI	Basket, Exchange, Wallet + marketing shell
4 — Polish	README, `.env.example`, production static + API serve path

9. Out of scope (v1)

- On-chain mint / burn / Phantom
- Physical warehouse or logistics partner integration
- USD / FX peg for LEEA
- Sync with PeaceChainAI ledgers
- Changes to `peaceism-ai-agent-mvp` agent phases

10. Success criteria

- Site shows basket definition and OR exchange as **separate** concepts
- Logged-in user can redeem N whole LEEA for exactly one option; balance drops; request shows `pending`
- Unit tests match the tables in §3 exactly
- Prior $PCSM dump remains readable under `legacy/`

11. Approval checklist

Mark each item:

- ☐ Basket schedule (§3.1) approved as written
- ☐ Redemption OR menu (§3.2) approved as written
- ☐ Whole-LEEA-only quote rule approved
- ☐ Off-chain app wallet (no Phantom in v1) approved
- ☐ Home folder `leeacoins-org/` rebuild approved
- ☐ Out-of-scope list (§9) accepted
- ☐ Authorize implementation to begin
